To His Honour,
THE HONOURABLE WALTER HAROLD COVERT, K.C.,
Lieutenant-Governor of Nova Scotia

Sir:—

I beg to present herewith the Report of the Department of the Public Health for the year ending September 30th, 1934, and of the Deputy Registrar General containing the Vital Statistics of the Province for the year ending December 31st, 1933.

I have the honour to be,

Sir,

Your most obedient Servant,

F. R. DAVIS

Minister of Health.

REPORT OF THE CHIEF HEALTH OFFICER

To the Honourable Frank R. Davis, M.D., F. A. C. S.
Minister of Health.

Sir:—

I have the honour to submit herewith my report for the year ending September 30th, 1934.

Health conditions in Nova Scotia during the year were entirely satisfactory. There were fewer deaths and a lesser incidence of communicable illnesses than in the year immediately preceding. Probably the greatest single achievement is the decline in mortality from Tuberculosis, the rate falling from 101 to 93 per 100,000. Another noteworthy occurrence is the drop in mortality from Whooping Cough, a disease which has always been responsible for more deaths than any other of the acute infections, excepting the respiratory diseases. The infant mortality rate is the lowest ever recorded in the province. This is significant since the number of infant deaths is usually considered the most reliable index available in determining whether or not Public Health is advancing or retrogressing.

There was a notable decline in the birth rate similar to that which has been taking place, of late years, in most civilized countries. This decrease tends towards a gradual change in the age composition of the people giving an increase in the proportion of older persons. With more older people, we naturally expect an increase in diseases common to aging of a population, such as Cancer, Kidney, Arterial and Heart affections.

Cancer

There were 638 deaths from Cancer in the calendar year 1933. This disease presents a rather discouraging picture, since. it shows a tendency to increase in importance as a cause of death A similar tendency is observed in the other Canadian provinces. Some investigators state that this is only an apparent increase and not really an additional prevalence, due to better diagnosis and aging of the population. After making due allowance for those factors, both important, it is thought there is, in fact, an increased prevalence.

Many forms of Cancer can be cured if discovered and treated in the early stages. In the attempted control of Cancer then, early recognition of slight departures from the normal, utilization of Cancer Clinics, and periodic physical examinations are recommended.

Heart Disease

Heart affections are the leading causes of death. They are largely associated with old age; consequently there is no great cause for alarm regarding their increase. While most heart diseases may be due to inevitable degenerative changes taking place with age, a considerable number are due to preventable causes. In childhood most heart disorders are due to Acute Rheumatic Fever. In early adult life Syphilis and other preventable infections are important causative factors. In dealing with heart affections much can be accomplished by early diagnosis, adequate treatment and suitable after care.

Tuberculosis

The phenomenal drop in the mortality from Tuberculosis, during the year, has already been referred to. There were 478 deaths against 519 the year before.

In their Case Finding Programme, our Field Clinicians, gave special attention to boarding school and college pupils, Normal School students, certain industrial workers, and contact children. These groups provide profitable approaches to the tuberculosis problem since it is realized that the disease still takes its greatest toll in the age period from fourteen to twenty-five years. Moreover, in this age grouping the mortality is not dropping as satisfactorily as it is in others. There has been an increase in the utilization of the laboratory and the clinic services provided. Actual growth is shown in field activities as indicated by more examinations and closer cooperation of physicians in referring patients. The percentage of cases diagnosed tuberculous has shown a steady and consistent decline.

Tuberculous disease results when people are infected with tubercle bacilli. When persons, especially children, are pro-

tected from exposure to these bacilli the disease does not occur. The sources of the bacilli are the persons affected, consequently when we sever the contact between the tuberculous and the non-tuberculous, we are taking scientific, practical, most important, and common sense steps to prevent the spread of the disease.

In the last fiscal year, 430 persons were given supervision in the Nova Scotia Sanatorium and 272 in the four general hospitals equipped with tuberculosis units. Those with sputum containing bacilli and living in direct contact with young children should have preference in admission to institutional beds. There they are put in favourable conditions for arrest, but of far greater importance, dangerous sources of infection are removed from susceptible associates.

Elsewhere will be found the reports of the Divisional Health Officers, touching, in more detail, the tuberculosis problem.

Whooping Cough

It is particularly satisfying to report a new low level in the mortality from whooping cough, since it has always been responsible for more deaths in our province than any other of the acute infections, excepting Influenza and the respiratory diseases. There were 21 deaths caused by it during the year and 33 in the previous year.

Whooping Cough should always be dreaded, particulary in infants where the death rate is exceedingly high. Everything possible should be done to protect infants from exposure to it. When contracted by healthy children over five years of age, the prognosis is good. Considerable work is now being done on a Vaccine which may prove to be valuable as a preventive.

Diphtheria

There were 9 deaths from Diphtheria in 1933 with a case incidence of over 100. While this is the lowest mortality yet recorded, nevertheless it means that this disease is still with us.

It should always be remembered that Diphtheria is definitley a preventable disease. The way to prevention lies in immunization with a preparation known as toxoid. Small quantities of this substance are injected beneath the skin, usually with no discomfort if given early in life. Reactions from its administration are rarely found in those under six years of age. The time of choice for giving toxoid is during the second half of the first year. The department therefore urges all parents to see that their children are protected by sending them to their doctors for toxoid administration.

Scarlet Fever

Scarlet Fever was responsible for 8 deaths, 454 cases were reported. The previous year there were eighteen deaths, with a notification of 470. While the virulence of this disease appears to have decreased in late years, nevertheless, it is still a very serious infection, especially in young children. Children should be shielded from the infection, particularly during the first few years of their life. Every year of escape leaves them less susceptible, until finally a marked degree of immunity de-

velopes.

In the past year there was a better distribution of the treatment serum and immunizing toxin used than ever before.

Small Pox and Vaccination.

There has not been a case of Small Pox in the province for some years. This fact, coupled with the existence of a considerable number of so-called conscientious objectors and oppositionists, is responsible for a generation with many unvaccinated individuals. Unvaccinated persons in any communtiy may be said to be living under conditions comparable to those inhabiting the vicinity of a volcano. A volcano does not necessarily erupt every month or every year.

In 1924 Small Pox of a most virulent type suddenly appeared in Windsor, Ontario. There were 67 cases with 32 deaths There was not a single case among those who had been vaccinated within twelve years prior to the outbreak, although some of them had been directly exposed; and not a death occurred in those who had been vaccinated at any time.

Similarly in the year 1932 Vancouver, B. C. was visited. There were 56 cases with 17 deaths. Here again not a case occurred in persons who had been vaccinated up to 15 years previously. In one family in which there were objectors, the father, brother, wife and three children contracted the disease and died. Two or three other children in the same home, who had been vaccinated in school, some years before, did not even contract it. Vaccination, when properly carried out, has not been shown to be injurious. Thousands of soldiers were made immune, during the late war, without any deleterious results.

Parents and all others responsible for the health and general care of children are importuned to have such children protected against Small Pox, by successful vaccination.

Measles

Measles is regarded by many people as a trivial disease, but when one considers the number of deaths due to it, together with the sequelae, over a period of years, it should not be dismissed lightly. Our usual methods to combat its spread are of small avail since it is one of the most contagious of the communicable diseases and particularly infectious before the eruption appears. The highest mortality occurs in children up to the age of three years.

Of late years Convalescent Serum and adult blood have been used in prevention and treatment with some success. Convalescent Serum will prevent an attack, but the immunity conferred, passes off quickly, probably in a few weeks, hence its practical value is limited. Adult whole blood may either prevent or perhaps better produce a modified light attack, leaving the child with that permanent immunity usually conferred by the ordinary course of the disease.

In 1933 eight persons in Nova Scotia died of Measles. Two more than in 1932.

Typhoid Fever

There were six deaths from Typhoid Fever in the calendar year 1933.

Improved sanitation has greatly reduced the prevalence of this disease in recent years. It is particulary gratifying that outbreaks due to infected water, or milk supplies, have not occurred in Nova Scotia for over ten years. Those who contracted Typhoid were thought to have received the infection from carriers, or from sources without the provice. In one locality, Typhoid Vaccination was employed to prevent its spread, from a few persons affected.

Infantile Paralysis.

Another year has passed without the occurrence of the expected epidemic of this disease. As usual a few sporadic cases were found with very few deaths. The appearance of Infantile Paralysis is always disturbing to parents and health officials. Some of the dread accompanying it has disappeared since the adoption of Convalescent Serum as a treatment measure. While doubt has been cast, by some, on the efficacy of this Serum, consistently good results have been reported from quarters where it has been extensively used. As an emergency precaution, the Public Health Laboratory Director had prepared a quantity which is being kept under proper temperature conditions for dispatch to any part of the province where it may be required.

Venereal Diseases

For obvious reasons, diseases of this type are exceedingly difficult to stamp out, since human nature remains from year to year, about the same. Their control depends, to a certain extent at least, upon early discovery, prompt and intensive treatment, and prevention of exposure.

Due to unemployment and adverse business conditions of late years, more and more people, who are unable to pay, have been seeking free treatment. This made it urgent upon the Department of Health, to shoulder more of the burden, in spite of the fact that federal aid is no longer given. The situation has been met, as far as possible, by supplying larger quantities of medicinal preparations to physicians willing to administer them. In addition the five free treatment centers have met the increasing demands made upon them in a praiseworthy manner.

Attributable to those diseases, 24 deaths have been reported, as against 37 the year immediately preceding. Despite all difficulties this would appear to represent a gain.

Infant Mortality

In 1933, the last year for which figures are complete, there were 791 infant deaths with a rate per 1,000 living births of 70.8. This is the lowest rate ever registered in Nova Scotia. This pronounced reduction is one of the most encouraging signs in the entire field of Public Health, since, as previously intimated, the infant death rate is the best exponent we possess of measuring healthfulness, as well as the value of existing health programmes.

Maternal Mortality

Deaths of mothers in childbirth and from complications surrounding childbirth, numbered 52. Of late years there is a slightly downward tendency in the maternal mortality rate. The Nova Scotian rate is lower than that of some of the other provinces and definitely below the all Canadian rate.

Prenatal and post natal letters were distributed to hundreds of mothers and expectant mothers. Those letters gave simple detailed instructions as to the care they should take of themselves, as well as specific information for the benefit of the developing children. This we believe was well worth the expenditure necessary, since the protection of the health of mothers and young children is one of the most important functions of all health workers.

Public Health Nursing

One does not have to go far in Public Health work to realize that a competent public health nursing service is not only desirable, but is definitely essential to the proper functioning of any modern health program.

The public health nurse gives valuable service to the expectant mother, and new born child; she supervises the preschool child, and school child; she aids in the prevention and

control of all communicable disease, particularly tuberculosis; and she distributes health education as no other person can. Such a service is recognized by all health workers as a first class investment which pays well in the prevention of suffering and in the prolongation and saving of human lives.

Since a great part of the present health campaign lies in teaching school children how to keep well, special attention was given the schools through the nursing service. In the schools the nurses attempted, to detect and prevent the spread of infectious diseases; to locate and have remedied defects which prevented the children from obtaining full benefit from the educational system provided; to insure sanitary conditions in the schools and surroundings; to promote proper physical development; and to instruct the children in the elements of healthful living.

Many visits were made to the homes in the interests of maternal and child welfare, to aid in the control of communicable diseases, and to assist in the adjustment of family or social conditions affecting health. It is now accepted that those best qualified to bring health education into the homes are the nurses who enter the homes to do health work.

Within the year, 37,589 school children were inspected, 5,219 special interviews were given to parents and others, and 16,578 visits were made in the homes.

Laboratories

A properly equipped, efficiently staffed, and well organized public health laboratory is, without a doubt, one of the foundations of modern health work. It is an important factor in coordinating all health activities. In providing an accurate and prompt diagnostic service, the laboratory helps to maintain a satisfactory relationship between the practicing physicians and the health department.

The directors' reports show a substantial increase in the diagnostic examinations made during the year. This, to a certain degree, indicates the extent to which health officers and physicians generally are coming to the laboratory for assistance

which is so essential to the practice of medicine, both preventive and curative. Milk and water examinations show large increases. This is a good indication since both are so important to health. Routine analysis of the municipal water supplies of the province indicated that, in general, they were in a satisfactory state. The laboratory service, coupled with carefull supervision by local health officers has, no doubt, had a direct bearing on the fact that no Typhoid Fever occurred which could be attributed to the use of municipal waters.

There was a marked increase in the number of tissue specimens forwarded to the pathological laboratory. This would indicate more interest by physicians and the people as a whole, in Cancer control, since the laboratory occupies the key position in any scheme for study, treatment and control of this disease.

Milk

Among the matters which have been given special laboratory attention during the year is found milk. The protection of the health of the people, through the regulation of the quality of milk supplies, continues to be of major importance.

A general awakening, with consequent improvement in the purity of the milk supply, has been noticeable since the milk law was strengthened and improved during the last session of the legislature. Especially noticeable has been the improvement in the city of Halifax. Through a system of cooperation between the director of the Public Health laboratory, the City Board of Health, and dairy operators, gratifying results have been obtained. This is entirely satisfactory since milk is undoubtedly the most important single article of food, containing as it does most of the essentials of a properly balanced diet. On the other hand, when not adequately supervised from producer to consumer, it has been found responsible for the production of more disease than any other food.

Conspicuous improvement in the pasturizing equipment and processing of some of the city dairies is noted; with the result that we now have, in some instances at least, real scientific pasturization. To those who have cooperated in bringing about this happy result, we are extremely grateful.

Notification

The importance of reporting all cases of notifiable diseases cannot be over-emphasized. The knowledge gained from reporting communicable diseases is the first step in their control. In order that Boards of Health and health officers be given an an opportunity to prevent spread of congagious illnesses, they must know when and where they are occurring. Many serious outbreaks of diseases can be traced to neglect in reporting the first cases seen.

I am pleased to report very definite improvement in notifications during the year.

Looking back over the years' activities, I am in a position to report very definite advances. Public Health is slowly but surely coming into its own. True it has not yet reached the objective it will surely reach some day, nevertheless substantial development is taking place and the principles of health are being accepted and applied by all civilized nations. Modern science will continue to prevent disease, to prolong life until everything possible is done in the direction of giving every citizen a standard of living which will ensure good health and longevity.

In closing permit me Sir to acknowledge my appreciation for your direction and advice which was, at all times, consistently sound. I wish to thank the Divisional Medical Health Officers for their loyalty and guidance. I have received the unfailing support of all the members of the staff so necessary to proper functioning of the department. Real appreciation is also felt for the valuable assistance rendered by the medical profession and the various voluntary health and social organizations.

I have the honour to be Sir,

Your obedient servant,

P. S. CAMPBELL, M. D.,
Chief Health Officer.

Halifax, N. S.,
September 30, 1934.

To the Honourable Frank R. Davis, M.D., F.A.C.S.
Minister of Health and Registrar General.

Sir:—

I beg to submit the report of the Deputy Registrar General for the year 1933.

The provincial birth rate for the year 1933 was 21.7 per 1,000 population. Total births reported were 11,164, a decrease of 465 from the preceding year. The general death rate was 11.7 per 1,000 population. The deaths from all causes numbered, 6,045 , being 114 fewer than in the year 1932. There were 791 deaths of children under one year, giving an infant mortality rate of 70.8, the lowest ever experienced in the province. The maternal mortality rate for the year is 4.6.

Since the division of Vital Statistics was put on a proper footing, hundreds of thousands of birth, death, and marriage certificates have accumulated. As a consequence the Bureau is prepared to issue, on request, certified copies of all documents that have been filed. There is a constant and increasing demand for these copies, and needless to say, they are used for a great variety of purposes.

Few people give serious thought to the importance of accurate and complete registration. Health officials are constantly using the accumulated data in a study of the general health conditions of the province. Vital Statistics furnish such officials with a valuable guide in the development of policies that will lead to mitigation of suffering, disease, and the conservation of life.

In order that there shall be accuracy and completeness in assembling such important tabulations, physicians, undertakers and many other individuals must cooperate with the local registrars, by providing the valuable data required. Every person who furnishes the information required, promptly and completely, is performing a public service of inestimable value to the whole province.

Appended will be found complete statistical tables arranged and classified in accordance with the national standardization.

I have the honour to be Sir,

Your obedient servant,

P. S. CAMPBELL, M. D.,
Deputy Registrar General.

Halifax, N. S.,
September 30, 1934.

REPORT OF DIVISIONAL MEDICAL HEALTH OFFICER

To the Chief Health Officer:

As Divisional Medical Health Officer of the Eastern Section of the province of Nova Scotia, I respectfully submit the following report.

It is gratifying indeed to see the increased interest shown in the prevention of tuberculosis by the general public, and all organized bodies, such as Service clubs, Societies and Benefit Organizations. These latter are to be commended for both their moral support and their practical assistance in the providing of X-Ray examinations, hospitalization, and other measures furthering prevention and treatment in the homes.

I specially bring to your attention the splendid co-operation afforded by all Municipal bodies. And by far the greatest single factor is the invaluable co-operation rendered by the family physician, without whose assistance the work could not be productive of the present results.

While sufficient time has not as yet elapsed for the computation of statistics to show the results derived from the institution of the Tuberculosis Annexes to the four hospitals in this district, it is only reasonable to conclude that the isolation of so many open cases will result in the decrease of the incidence of Tuberculosis.

The hospitals are to be congratulated for assisting the work by minimizing the cost to the patient of X-ray examinations and affording facilities as required by clinical work.

My observations lead me to state:

(1) That prevention is vastly more important in the control of Tuberculosis than treatment. However, nothing should be spared in respect to treatment to bring about the recovery of those suffering from the disease.
(2) That the benefit of the examinations of groups of individuals over a period of years, as conducted in

hospitals, religious orders, educational institutions, is apparent when now rarely is a new case of tuberculosis found amongst these groups. In particular I wish to refer to one industrial organization, which now requests an annual examination of its personel. As a result of this, Tuberculosis has been eliminated from its members.

Following is a resume of the examinations carried out in this division during the year:

Number of positive cases seen for first time	140
" of positive cases re-examined	469
" of suspected cases seen for first time	180
" of suspected cases re-examined	54
" of negative cases seen for first time	781
" of negative cases re-examined	559
Total	2183

To all physicians, voluntary workers, and others who assisted in the work of Tuberculosis control, I am extremely grateful.

Respectfully submitted,

C. M. BAYNE, M. D.,

Divisional Medical Health Officer.

Sept. 30. 1934.

REPORT OF DIVISIONAL MEDICAL HEALTH OFFICER

To the Chief Health Officer:

I beg to submit my report for the fiscal year ending September 30, 1934.

My efforts as Divisional Medical Health Officer have been mainly directed to the tuberculosis problem, a problem of major proportions, and of the communicable disease group the one requiring the most serious consideration, particularly from the view point of control. To combat the disease with satisfying results, it requires unabating interest and vigilance on the part of the Department of Public Health, the medical profession and the public, in the use of the only weapons of control known to the world at the present time. More simple and efficient methods may come out of the future, but in the meantime we must not falter. The result of co-operative effort is becoming more manifest and widespread and at nearly all points people are more concerned in the treatment and control of tuberculosis than was the case in days gone by. Continued and unrelenting campaigning against the onslaught of tuberclosis will surely result in bringing the number of active cases down to satisfactory minimum. That should be our objective. Beyond that lies the Utopia, in the far distant.

The Public Health Nursing Service has been of inestimable value and the returns from their most valuable instructions will be measured in terms of a healthier people in the years as they come upon us. Their arduous tasks include school, tuberculosis follow up and other services. I sincerely hope that in the not far future, when circumstances permit, the service will have an increase in number so that each municipality shall be served individually. A capable, efficient nursing service is the pivotal point in tuberculosis control. They serve the homes and it is to the homes we must direct the greatest part of our energies and efforts. This I emphasize, as the greater number of our cases are in the homes—as our institutional capacity is of necessity comparatively small,—and furthermore these cases must remain in the homes, so there we must direct our

efforts for the most part, and this can be done only by an energetic Public Health Nursing Service, working in conjunction with the family physician.

During the year the following clinical work was done by me:

Number of chest examinations	1722
" of Positive cases seen for first time	168
" of Positive cases re-examined	323
" of Suspected cases seen for first time	111
" of Suspected cases re-examined	67
" of Negative cases seen for first time	708
" of Negative cases re-examined	345

I wish to take this opportunity of expressing my appreciation to the Honourable Minister for his kind co-operation; to you sir for your always availabe valuable advise, and to all other members of the Departmental and nursing staff for their kind assistance. I also wish to thank the members of the medical profession for their most hearty co-operation. Without this co-operation, our efforts in Public Health Service would be barren of results.

Respectfully submitted,

J. J. MacRITCHIE, M. D.,
Divisional Medical Health Officer.

Halifax, N. S., Sept. 30, 1934.

REPORT ON THE WORK OF THE PUBLIC HEALTH LABORATORY. HALIFAX, N. S.

To the Chief Health Officer:

During the fiscal year ending September 30, 1934 a total of 38,215 specimens of various kinds were examined and reported upon.

They have been classified as follows:

Kahn tests, blood		8955
	Positive	1866
	Negative	6891
	Unsatisfactory	198
Hinton tests		8001
	Positive	1923
	Negative	6078
Smears for Gonococci		3720
	Positive	933
	Negative	2761
	Unsatisfactory	26
Sputum for Tubercle bacilli		4791
	Positive	1705
	Negative	3065
	Unsatisfactory	21
Throat Swabs		1580
	Positive for Diphtheria	162
	Negative for Diphtheria	1318
	Haemolytic Streptococci	64
	Vincent's angina	36

Widal agglutination tests 2359

B. typhosus	Positive	11
	Negative	201
B. paratyphosus A.	Positive	6
	Negative	206
B. paratyphosus B.	Positive	11
	Negative	201
B. proteus X-19	Positive	0
	Negative	130
B. tularense	Positive	1
	Negative	133
Br. abortus	Positive	34
	Negative	694
Br. melitensis	Positive	16
	Negative	712
	Unsatisfactory	3

Cows' Blood for Br. abortus 248

Positive	48
Negative	200

Spinal Fluids 1140

Routine	293
Quantitative Protein	106
" Chlorides	191
Lange curve	274
Kahn test: Positive	42
Negative	234

Urines for Tubercle bacilli 433

Positive	31
Negative	402

Faeces for Dysentery		420
Faeces for Typhoid		179
Pleural fluids		136
Urines for Typhoid		125
Miscellaneous		332
Water		1534
Bacteriological	1315	
Chemical	540	
Unsatisfactory	4	
Milk and Cream		3804
Bacteriological	3584	
Butterfat	220	
Empty milk bottles		133
Bacterial count	133	
TOTAL		38,215

The work carried out this year shows the rapidly increasing demand for additional diagnostic laboratory work in this province. There is an increase of 10,110 specimens, or 36 per cent. above that of the preceding year; and accounted for mainly by a greater number of Hinton tests, milk examinations and sputum.

During the past year, agglutination tests for the diagnosis of Tularaemia and Endemic Typhus were carried out as a routine procedure on all blood specimens submitted for Widel tests. More quantitative work was instituted in the examination of spinal fluids, these being of greater value to the clinician than the qualitative tests previously carried out.

There were three changes in the staff during the period under review, the resignation of Mrs. J. W. Dobson, and the appointment of Miss Elizabeth Webster, B.Sc., and Miss Pauline Miller, M.Sc., as technicians.

All of which is respectfully submitted,

(Sgd.) DR. D. J. MACKENZIE,

Director,
Public Health Laboratory.

REPORT OF THE PROVINCIAL PATHOLOGIST

For the year ending September 30, 1934.

To the Chief Health Officer:

During the year, 2282 specimens of tissue of various kinds were received and reported upon.

They have been classified as follows:—

Tumours, malignant	370
Tumours, simple	157
Tumours, suspicious of malignancy	19
Tumours, pre-cancerous	3
Tissues from other conditions	1437
Tissues from 63 Post Mortem examinations	296
TOTAL	2282

There were 772 more tissues sectioned in 1934 than in the previous year, which is an increase of 51 per cent. for the year. Since Free Examination of tissues from government owned or aided Institutions was inaugurated in Oct. 1931, the number of tissues examined has increased 2 1-2 times.

During the year 26,013 specimens of various kinds were received and reported upon (i.e. from all sources including Victoria General Hospital).

They have been classified as follows:—

Blood		8,217
Bilirubin,	Van den Bergh reaction	16
	Fouchet Test	68
	Icterus Index	84
Bleeding Time		153
Bromsulphthalein Test for Liver Function		3
Calcium		11
Chlorides		1
Cholesterol		1

Clot Retraction Time	4	
Coagulation Time	557	
Compatibility Tests	233	
Counts, Arneth	2	
Full Blood Picture	4351	
Haemoglobin (alone)	9	
Leucocyte Count	15	
Red Cell Count	1	
Platelet Count	5	
Reticulocyte Count	50	
Blood Films, Differential Count	186	
Blood Films, Malarial Parasites	4	
Creatinine	532	
Cultures	77	
Cyanide	1	
Fragility Test	5	
Grouping	146	
Kahn Test	5	
Stains on garments and articles for human blood	7	
Phosphorus	3	
Sugar	646	
Sugar Tolerance Series	12	
Urea Nitrogen	576	
Uric Acid	506	
Widal Test for Typhoid	2	
Spinal Fluid		2
Cerebro Spinal fluid, routine	1	
Cerebro Spinal fluid for Alcohol	1	
Faeces		1,005
Arsenic	1	
Occult Blood	879	
Bile and Urobilin	4	
Culture for Organisms	6	
Fat	19	
General Microscopical examination	16	
Lead	1	
Parasites	79	

Hair and Skin for Ring Worm Parasites	7
Gastric Contents	326
Alcohol, methyl, ethyl	12
Alkaloids	1
Carbolic Acid	1
Fractional test meals (complete analysis)	298
Poisons (arsenic, lead, strychinine)	14
Various Exudates and Transudates	195
Abdominal fluid	12
Ascitic fluid	18
Fluid from hand	2
Fluid from gland	1
Fluid from knee	8
Fluid from neck	1
Drainage from Gall-bladder	18
Pus various sites	128
Pus, for actinomycosis	7
Smears	19
From Prostate	3
From Urethral	7
From Vagina for Gonococci and Trichomonas hominis	1
Garments for spermatozoa	7
Dark Ground Illumination for Spirochates	1
Milk	2
Breast, Bacteriological examination	1

REPORT OF THE SUPERINTENDENT OF NURSING SERVICE

To the Chief Health Officer,

Sir:

I beg to present the report of the Public Health Nursing Service for the year ending September 30, 1934.

Although the appended summary of the activities of the nurses in not complete in detail, it shows the tremendous amount of work accomplished by them. In 1933, these nurses spent 19 per cent. and 22.8 per cent. of their total working hours in homes and schools respectively. The reports for 1934 showed that 24.6 per cent and 22.6. per cent. of their time was spent on this work.

The nurses are frequently requested to deal with various problems and satisfactory results are usually obtained. Their work assumes even a new importance in aiming to check the damage that followed the recent economic depression. An effort is always made to introduce modern methods in the adjustment of problems.

Over Five Hundred sets of the prenatal letters and 1060 publications on the care of infants were distributed direct from the office during the year. Requests for posters, and public health leaflets were received from One hundred teachers and more than Two hundred other interested persons. In addition to the prenatal and postnatal series of letters, a set dealing with the care of the preschool child is now available for free distribution on application to members of the staff. These are supplied to the Department by the Canadian Council on Child and Family Welfare.

Two hundred holders for refills and 52,350 refills were distributed free to tuberculous cases on the request of physicians and the staff nurses. The year previous to the appointment of the additional nurses in 1932, only 27,191 refills were dis-

tributed. This is definite evidence that as the result of the instructions given by the nurses, the patients are endeavouring to carry out measures to prevent the spread of disease. The careful tuberculous patient is a factor in the eradication of the disease. A more complete record of the known cases is being kept.

The outstanding problems encountered and arrangements made for the expansion of activities are discussed at the conferences that are held annually for the staff. The information received by the nurses continues to be of inestimable value to them.

The nursing staff is the same in mumber as that of last year. Due to illness, one has been temporarily replaced for several months. The achievements obtained is due greatly to the nurses who frequently working under difficult conditions have not failed to consider that they are pioneers in a field of service for the betterment of humanity.

In conclusion, may I express my sincere thanks for the assistance and consideration received from individuals and organizations.

Respectfully submitted,

MARGARET MACKENZIE,
Superintendent of the Nursing Service.

Halifax, N. S.,
Sept. 30, 1934.
